

**I CLAIM:**

1. A detachment tool for use in detaching a detachable part from a two-part article having a fixed part and a detachable part, said detachment tool comprising:

(a) a grip portion; and

(b) an extension portion extending from said grip portion, said extension portion being generally wedge shaped and having a first end portion connected to said grip portion and a second end portion having an opening for receiving there within the detachable part of the two-part article.

2. The tool as defined in claim 1 in which said grip portion comprises a plurality of longitudinally extending, spaced apart ribs.

3. The tool as defined in claim 1 in which the opening in said first end portion comprises a first outer portion of the first size and a second inner portion of a second smaller size.

4. A detachment tool for use in detaching a detachable part from a two-part article having a fixed part and a detachable part, said detachment tool comprising:

(a) an elongated hand and finger grip portion having a plurality of circumferentially spaced rib portions; and

(b) a generally wedge shaped extension portion extending from said grip portion, said extension portion having an end portion connected to said grip portion and a body portion terminating in a pry element, said body of portion having a first generally U-shaped opening of a first size and an adjacent, second generally U-shaped opening of a second smaller size.

5. The tool as defined in claim 1 in which said grip portion is constructed from a yieldably deformable material.
